PROFESSIONAL SUMMARY

Senior Software Engineer with 10+ years of experience designing and delivering scalable, high-availability microservices and distributed systems across Telecom, Healthcare, and Agri-SaaS domains. Deep expertise in Java, Spring Boot, Database and event-driven architectures. Proven track record of leading full-cycle feature development, mentoring engineering teams, and driving system modernization from monoliths to microservices.

TECHNICAL SKILLS

Languages: Java (primary), C#(prior experience), JavaScript

Frameworks & Libraries: Spring Boot, Spring MVC, Spring Security, Spring Data JPA, Hibernate, J2EE

Web : HTML, CSS, JQuery, Angular, Bootstrap, Typescript

Cloud & DevOps: AWS, Docker, Kubernetes, OpenShift, Jenkins, Maven, Git, CI/CD Pipelines

Databases: Oracle, MySQL, PostgreSQL, Redis (cache), MongoDB

Messaging & Streaming: Apache Kafka, RabbitMQ, AWS SQS

Observability & Distributed Tracing: Grafana, Prometheus, ELK (ElasticSearch, Logstash, Kibana), Zipkin, Jaeger

Testing & Quality: JUnit, Mockito, Sonar, Coverity, Postman

Protocols & APIs: RESTful APIs, SOAP, gRPC

Methodologies: Agile/Scrum, TDD, SDLC

AI-Assisted Development: Claude AI (architecture design, code review, documentation), ChatGPT (rapid prototyping, debugging support)

Other: Database Systems, Algorithms, Data Structures, Design Patterns

PROFESSIONAL EXPERIENCE

Senior Software Engineer May 2024 – Present

Etisalat (e&), Dubai, UAE — Telecom | ETBILL Billing Platform

- Decomposed a legacy monolithic billing system into domain-driven microservices (Java, Spring Boot, gRPC, OpenShift), establishing independent deploy boundaries per billing subdomain and eliminating cross-team release coupling.
- Applied CQRS to the bill-read path, routing 100,000+ RPM month-end read traffic to dedicated Oracle read replicas fronted by a Redis cache layer, achieving sub-100ms p99 latency while keeping the write pipeline uncontended.
- Designed the BSCS Billing System integration over gRPC
- Improved system performance using multithreading and concurrency optimization
- Instrumented the microservices layer with ELK Stack and structured JSON logging, enabling distributed trace correlation across services and reducing mean time-to-detect production incidents.

Senior Software Engineer Nov 2021 – May 2024

Networa, Dubai, UAE — AdTech | NotifyAI Push Notification Platform

- Designed the browser-based Web Push delivery architecture (Java, Spring Boot, Kafka, Redis, MariaDB) as a fan-out pipeline: producer services published events to partitioned Kafka topics, consumer workers processed and dispatched notifications to Chrome and Firefox via the Web Push Protocol (RFC 8030) using VAPID authentication.
- Built a high-throughput Kafka consumer pipeline for click-event ingestion, using partition-keyed writes and backpressure-aware consumers to sustain high write volume without data loss under traffic bursts.
- Engineered a distributed impression counter using Redis atomic INCR operations with TTL-bucketed keys, providing real-time per-ad delivery metrics at scale without hitting the primary database.
- Implemented an offer recommendation engine that scored and ranked advertiser offers per subscriber using behavioral signals (click history, geo, device etc), increasing click-through rate through targeted ad matching.

- Integrated third-party ad network APIs (Yahoo, Voluum) via REST adapters with circuit-breaker patterns, isolating failures in external systems from internal delivery SLAs.

Lead Software Engineer*Dec 2020 – Nov 2021*

North Ladder, Dubai, UAE — Trading | HyperBid Buy-Back Platform

- Designed the HyperBid auction engine so that item submissions automatically triggered the auction workflow, with live auction state held in Redis for low-latency bid responses and all transactional records durably persisted in PostgreSQL.
- Stored electronics and luxury item listings in MongoDB to accommodate their semi-structured, schema-variable attributes (specifications, condition grades, brand metadata) — avoiding rigid relational schema changes each time a new product category was onboarded.
- Integrated third-party logistics provider APIs to automate item pick-up and delivery booking, triggering shipment requests automatically on auction completion and eliminating manual coordination between sellers and the logistics team.
- Established CI/CD pipelines on AWS for deployment.

Lead Software Engineer*Jan 2020 – Dec 2020*

Xyram Software — Healthcare IT | InteropX Patient Data Platform

- Built a data ingestion pipeline that received patient data from hospital systems (OpenEMR and other EHRs) in HL7 and FHIR formats, processed and standardized the records, and stored them in PostgreSQL for reporting and analysis.
- Implemented data format conversion between HL7 and FHIR standards, enabling different hospital and government health systems to exchange patient data with each other seamlessly.

Senior Software Engineer*Oct 2018 – Jan 2020*

Wipro Limited — Consulting | Telstra Telecom Microservices

- Built stateless Spring Boot REST microservices consumed by multiple internal Telstra platform services, designed for horizontal scalability on AWS with MongoDB NoSQL as the primary store for high-read telecom subscriber data.
- Optimized MongoDB document design and query patterns to reduce read latency for telecom data workloads.
- Containerized and deployed services on AWS, defining environment configurations and health-check strategies to support zero-downtime deployments.

Software Engineer *2012 – 2018*

CropIn Technology — AgriTech SaaS | Smart Farm Services Platform

- Joined as a fresh graduate and built core modules of the Farm Management System as a full-stack .NET application (ASP.NET, ADO.NET, SQL Server), implementing multi-tier business logic for crop life-cycle tracking from sowing to harvest.
- Designed and maintained relational database schemas in SQL Server, writing stored procedures and functions for business-critical workflows; optimised high-volume reporting queries using indexed views, reducing report generation time by ~60% for enterprise clients including PepsiCo and ITC.
- Diagnosed and resolved a critical date-format bug in the bulk Excel upload pipeline — where dd/mm dates were silently parsed as mm/dd by the .NET runtime — by implementing a strict ISO 8601 parsing layer with client-side validation, eliminating farm record data corruption affecting ~15% of uploads.
- Built the analytics dashboard data warehouse layer, designing denormalised aggregate tables that reduced dashboard load time from 8–10 seconds to under 2 seconds by decoupling reporting from the live OLTP schema.
- After the company migrated from .NET to Java (approx. 2015), transitioned to Spring MVC for server-side web development and subsequently led the move to microservices using Spring Boot.
- Deployed Spring Boot services to AWS Elastic Beanstalk with auto-scaling policies and CloudWatch alarms configured to handle variable agricultural-season traffic spikes.
- Took initiative to modernise the front end by introducing AngularJS and Bootstrap, leveraging two-way data binding to replace server-rendered pages with a more responsive single-page experience for field agents and farm managers.
